

Supplementary Figure

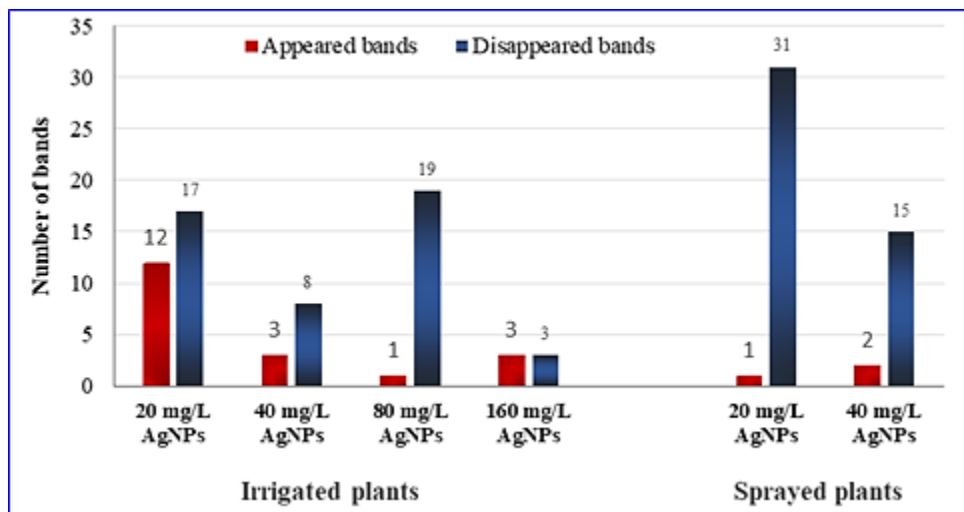

Figure (5, supplementary): Histograms demonstrating the number of newly expressed and absent ISSR bands in M2 pea plants previously irrigated with AgNPs solutions at different concentrations (mg/L): 20, 40, 80 and 160 versus to sprayed plants with 20 mg/L and 40 mg/L AgNPs solutions. The variation in ISSR fingerprinting was compared to the control (0 mg/L of AgNPs solutions).
